

Junior Data Scientist / Machine Learning Analyst

Job Description & Role Requirements

Role Overview

We are seeking a data-driven problem solver to bridge the gap between raw data and actionable business strategy. The ideal candidate will have hands-on experience building predictive pipelines, cleaning complex datasets, and deploying web-based machine learning applications to solve real-world problems.

Key Responsibilities

- Design, train, and deploy machine learning models (both classification and regression) to address domain-specific challenges, such as financial risk assessment or system security.
- Build automated data pipelines, ensuring data lineage, reproducibility, and version control for machine learning workflows.
- Develop interactive business intelligence dashboards to translate complex statistical analysis and data models into actionable insights for non-technical stakeholders.
- Perform rigorous exploratory data analysis (EDA), feature engineering, and data cleaning on raw datasets extracted from cloud data warehouses.

Required Qualifications

- Bachelor's degree in Computer Science, Engineering, Mathematics, or a highly related analytical field.
- Strong programming proficiency in Python, with a deep understanding of its modern data manipulation and machine learning ecosystems.
- Solid command of SQL for querying, transforming, and extracting large volumes of data from relational databases.
- Hands-on experience with model evaluation techniques, hyperparameter tuning, and automated machine learning (AutoML) frameworks.
- Proven ability to package and deploy machine learning models into interactive, user-facing web applications.

Preferred Skills (Nice-to-Have)

- Familiarity with data versioning concepts and foundational MLOps practices.
- Prior project experience dealing with financial risk modeling or cybersecurity data analytics.
